Purpose

This is a short How-To Guide designed to help users that are submitting data to ECS get started with the NASA Best Practices for ISO 19115 and the related EOS extensions.

Requirements

- An XML editor (any text editor will do but an XML editor would be ideal).
- Knowledge of how to write valid XML code.

Instructions

1. If a metadata file already exists, open the file with the XML editor.

Tips & Warnings

- In many cases, ISO allows you to document an attribute in multiple ways. It is important the user carefully review the EOS extension and its recommended attribute mappings. Failure to do so may cause a submitted file to fail.
